ACKNOWLEDGMENT

It gives us immense pleasure to express our sincere gratitude to the management of **Sir M. Visvesvaraya Institute of Technology,** Bengaluru for providing the opportunity and the resources to accomplish our project work in their premises.

On the path of learning, the presence of an experienced guide is indispensable and we would like to thank our guide **<<Name of the Guide>>,** <<**Designation**>>, Dept. of ISE, for her invaluable help and guidance.

Heartfelt and sincere thanks to **Dr. G. C. Bhanu Prakash,** HOD, Dept. of ISE, for his suggestions, constant support and encouragement.

We would also like to thank the staff of Department of Information Science and Engineering and lab-in-charges for their co-operation and suggestions. Finally, we would like to thank all our friends for their help and suggestions without which completing this project would not have been possible.

The growth in popularity of social networking leads to the problematic usage. An increased number of social network mental disorders, such as Cyber-Relationship Addiction, Information Overload, have been recently noted. Symptoms of these mental disorders are usually observed less today, resulting in delayed clinical intervention. In this paper, we argue that mining online social behavior provides an opportunity to actively identify depression at an early stage. It is challenging to detect disorders because the mental status cannot be directly observed from online social activity logs.

Our approach, new and innovative to the practice of mental depression detection, does not rely on self-revealing of those mental factors via questionnaires in Psychology. Instead, we propose a machine learning framework that exploits features extracted from social network data to almost accurately identify potential case
